

Note: 2n7000 Transistors are not mandatory.
Eliminating those would require you to invert DUT-Reset and DUT-VCC logic levels in the program.
(HIGH would mean LOW and LOW would mean HIGH for these pins).
2n7000s is just for convinience and make program less confusing!

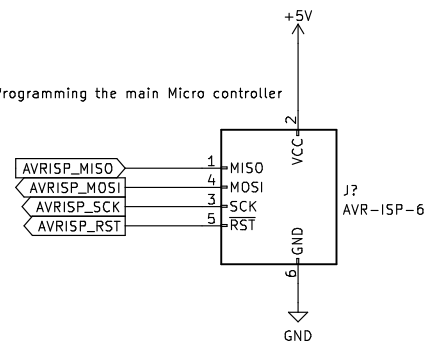

+5V for powering on the main MCU and DUT
and also for the programmer

+12V for entering the parallel programming mode

For Programming the main Micro controller

:D
